

REVISION POLICY

In terms of existence of medical problems associated with your procedure we offer revision plastic surgery treatment. (All your medical information that you have provided must be complete and accurate. Any additional or new-diagnosed health disorders those lead to complication are not covered; for example if you have underlying health disorder like any vascular problem which can not be detected with any regular preoperative assessment and that leads to complication like delayed healing, bad scarring, immune weakness that may result with infection we still offer treatment but you cover costs.) but if complications are related to surgery we cover operational costs and correct it.

On the other hand postbariatric patients healing capacity, scar quality, bleeding pattern, skin characteristics is slightly poor compared to regular population. Basically excess skin is removed however remaining skin is your own skin and will still keep its own features like if it is loose, dry, wrinkly it will still be. Tightening effect is best observed in areas which are closer to scars for any procedure and tightness on skin will reduce as it is far from scar site(for example with a regular tummy tuck skin is tight at lower belly and gets looser on areas above belly button; with a inner thigh lift skin is tighter on inner thigh but effect is reduced on front back and outer thigh)

In terms of cosmetic satisfaction this is an area which has no quantitative method to assess the success. This is why we can not offer a complete revision on those cases. But we will be in good intention if expectations and problems are reasonable
